STEP 1: Configure device to connect to your Wi-Fi

<mark>Begin</mark>

Before scanning this QR, power up the device for at least 15 seconds.

Wait for your computer or mobile phone to connect to the device.
When the device is connected to your computer (mobile phone), you will surely get a message that it is connected but that it does not have Internet access.
Don't panic because it's normal. You have connected a device that does not yet have an Internet connection.
Now scan the QR below to open the configuration.

When the configuration page opens, select your Wi-Fi connection in the dropdown list (refresh the page if your wi-fi network is not listed), enter its password and press the Submit button.
Device will reboot and try to connect to your Wi-Fi.
AP (local access) remains disabled as long as the device has a Wi-Fi connection and has not been restarted.
You can close the browser on your computer because you will have the message:
Hmmm... can't reach this page
This is normal because the device has rebooted.
If all has gone well, the device will connect to the database via your Wi-Fi.
If you made a mistake (SSID or password), the device will reactivate the local access (AP).
You must wait for a while (5 minutes) if you cannot connect to the device immediately and start again from the beginning.
